What Does a Tamper Resistant Receptacle (TRR) Do?

Serious injuries result when common household objects are pushed into the slots.

TRRs replace standard outlets to protect children from injury.

A built-in shutter system prevents objects from being inserted.

Unprotected outlets are a hazard for small children.

Plugs can still be easily inserted when equal pressure is applied to both slots.

Tamper resistant receptacles (TRRs) provide a simple, permanent solution for preventing common childhood shock and electrical burn injuries.
